## Experiment No. 6

**Title:** Program for data structure using built in function for link list, stack and queues

**Aim:** To study and implement data structure using built in function for link list, stack and queues

**Objective:** To introduce data structures in python

### Theory:

Stacks -the simplest of all data structures, but also the most important. A stack is a collection of objects that are inserted and removed using the LIFO principle. LIFO stands for “Last In First Out”. Because of the way stacks are structured, the last item added is the first to be removed, and vice-versa: the first item added is the last to be removed.

Queues – essentially a modified stack. It is a collection of objects that are inserted and removed according to the FIFO (First In First Out) principle. Queues are analogous to a line at the grocery store: people are added to the line from the back, and the first in line is the first that gets checked out – BOOM, FIFO!

### Linked Lists

The Stack and Queue representations I just shared with you employ the python-based list to store their elements. A python list is nothing more than a dynamic array, which has some disadvantages.

The length of the dynamic array may be longer than the number of elements it stores, taking up precious free space.

Insertion and deletion from arrays are expensive since you must move the items next to them over

Using Linked Lists to implement a stack and a queue (instead of a dynamic array) solve both of these issues; addition and removal from both of these data structures (when implemented with a linked list) can be accomplished in constant  $O(1)$  time. This is a HUGE advantage when dealing with lists of millions of items.

Linked Lists – comprised of 'Nodes'. Each node stores a piece of data and a reference to its next and/or previous node. This builds a linear sequence of nodes. All Linked Lists store a head, which is a reference to the first node. Some Linked Lists also store a tail, a reference to the last node in the list.

### code-

```
class Node:
```

```
    def __init__(self, data=None):
```

```
        self.data = data
```

```
        self.next = None
```

```
class LinkedList:
```

```
    def __init__(self):
```

```
        self.head = None
```

```
# Traversing the linked list and printing elements with their indices
```

```
def traverse_with_index(self):
```

```
    current = self.head
```

```
    index = 0
```

```
    while current:
```

```
        print("Index:", index, "Data:", current.data)
```

```
        current = current.next
```

```
        index += 1
```

# Appending an element at the end of the linked list

```
def append(self, data):
```

```
    new_node = Node(data)
```

```
    if self.head is None:
```

```
        self.head = new_node
```

```
    return
```

```
    last_node = self.head
```

```
    while last_node.next:
```

```
        last_node = last_node.next
```

```
    last_node.next = new_node
```

# Inserting an element at a specific index

```
def insert_at_index(self, index, data):
```

```
    new_node = Node(data)
```

```
    if index == 0:
```

```
        new_node.next = self.head
```

```
        self.head = new_node
```

```
    return
```

```
    current = self.head
```

```
    position = 0
```

```
    while current and position < index - 1:
```

```
        current = current.next
```

```
        position += 1
```

```
    if current is None:
```

```
        print("Index out of range.")
```

```
    return
```

```
new_node.next = current.next
```

```
current.next = new_node
```

# Removing an element at a specific index

```
def remove_at_index(self, index):
```

```
    if index == 0:
```

```
        if self.head is None:
```

```
            print("List is empty.")
```

```
            return
```

```
            self.head = self.head.next
```

```
            return
```

```
    current = self.head
```

```
    position = 0
```

```
    while current and position < index - 1:
```

```
        current = current.next
```

```
        position += 1
```

```
    if current is None or current.next is None:
```

```
        print("Index out of range.")
```

```
        return
```

```
    current.next = current.next.next
```

# Replacing an element at a specific index

```
def replace_at_index(self, index, data):
```

```
    current = self.head
```

```
    position = 0
```

```
    while current and position < index:
```

```
current = current.next
```

```
position += 1
```

```
if current is None:
```

```
    print("Index out of range.")
```

```
    return
```

```
current.data = data
```

```
# Searching for the location of an element by its index
```

```
def search_by_index(self, index):
```

```
    current = self.head
```

```
    position = 0
```

```
    while current and position < index:
```

```
        current = current.next
```

```
        position += 1
```

```
    if current is None:
```

```
        print("Index out of range.")
```

```
        return
```

```
    return current.data, position
```

```
# Size of the linked list
```

```
def size(self):
```

```
    count = 0
```

```
    current = self.head
```

```
    while current:
```

```
        count += 1
```

```
        current = current.next
```

return count

# Example usage

```
if __name__ == "__main__":
```

```
    linked_list = LinkedList()
```

# Appending elements

```
    linked_list.append(10)
```

```
    linked_list.append(20)
```

```
    linked_list.append(30)
```

```
    print("Traversing with index:")
```

```
    linked_list.traverse_with_index()
```

# Inserting an element at index 1

```
    linked_list.insert_at_index(1, 15)
```

```
    print("\nAfter inserting at index 1:")
```

```
    linked_list.traverse_with_index()
```

# Removing an element at index 2

```
    linked_list.remove_at_index(2)
```

```
    print("\nAfter removing at index 2:")
```

```
    linked_list.traverse_with_index()
```

# Replacing an element at index 0

```
    linked_list.replace_at_index(0, 5)
```

# Vidyavardhini's College of Engineering & Technology

## Department of Computer Engineering

```
print("\nAfter replacing at index 0:")

linked_list.traverse_with_index()

# Searching for the location of an element at index 1

data, position = linked_list.search_by_index(1)

print("\nElement at index 1 is:", data)

# Size of the linked list

print("\nSize of the linked list is:", linked_list.size())
```

### output:

```
PS C:\Users\Student\Desktop\py> & C:/Users/Student/AppData/Local/Programs/Python/Python311/python.exe c:/Users/Student/Desktop/py/Untitled-1.py
Traversing with index:
Index: 0 Data: 10
Index: 1 Data: 20
Index: 2 Data: 30

After inserting at index 1:
Index: 0 Data: 10
Index: 1 Data: 15
Index: 2 Data: 20
Index: 3 Data: 30

After removing at index 2:
Index: 0 Data: 10
Index: 1 Data: 15
Index: 2 Data: 30

After replacing at index 0:
Index: 0 Data: 5
Index: 1 Data: 15
Index: 2 Data: 30

Element at index 1 is: 15

Size of the linked list is: 3
PS C:\Users\Student\Desktop\py>
```

**Conclusion:** Data structures python has been studied and implemented.
